## SPRAYLOGGER PRO

The SprayLoggerPRO (SLP) is a simple and price-friendly solution to provide your existing sprayer with pressure registration. With the SLP your sprayer will meet the requirements as included in the Activities Regulation Environmental Management of the Dutch Government. The SLP is suitable for all brands and types of sprayers and can easily be assembled (by you or your dealer).

### Delivery scope;

The system consists of a data logger, a highly accurate and calibrated pressure sensor and instructions. The data logger is in a robust and weather-resistant polycarbonate housing and is equipped with push buttons. The system can be mounted at any location on the sprayer as long as the pressure sensor is positioned as close as possible to the existing pressure sensor of the sprayer.

The system is normally in rest position to save the built-in penlite batteries. When the machine starts to move, it will be detected and the system will automatically switch on.

While spraying, one of the dots on the display will flash every 5 seconds to indicate that the registration is active. The time-coded pressure is then stored in the SLP every 10 seconds. The pressure measurements shift so that the required pressures of only the last hour can be read. When the machine has been standing for one consecutive hour, the system goes into sleeping mode.

It is possible to connect the SLP on a 12V facility to guarantee operation with a potential empty battery.

Reading the pressure is simple. You can scroll to the desired time with the arrows, then press the enter key so you can read the pressure of that moment. If you do not operate anything for 30 seconds, the screen turns off (battery saving).
